Agenda

- Graph
- Terminology
- Connectivity
- Isomorphism

Graph

A graph G = (V, E) consists of a set of vertices V, and a set of edges E

School of Computer Science and Engineering South China University of Technology

 $V = \{a, b, c, d, e, f\}$ 

 $E = \{ (a,b), (a,c), (a,d), (b,e), (c,d), (c,e), (d,e), (e,f) \}$ 

- **Graph Structure**
- Key questions about Graph Structure

2

4

- Directed / Undirected Edge?
- Single / Multiple Connection?
- Loop?

IV: the number of vertices

Sometimes referred as arc

 Connection between a pair of vertices (v, w), where v

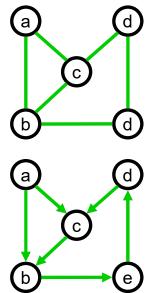

and w belong to V

E: the number of edges

Weight may be included

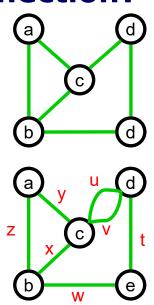

## Graph Structure Directed/Undirected?

- Undirected Graph
  - Edges are not directed
  - If (a,b), then (b,a)
- Directed Graph (Digraph)
  - Edges are directed
  - (a,b) does not mean (b,a)

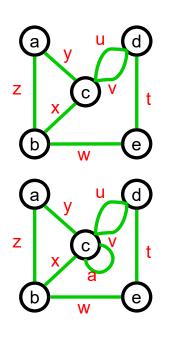

# Graph Structure Single/Multiple Connection?

- Simple Graph
  - No two edges connects the same pair of vertices
  - Loop is not allowed
- Multigraph
  - Two vertices may be connected by more than one edges
  - An edge cannot be identified uniquely by a pair of vertices
    - Additional name is needed
    - E.g. (c,d) means u or v

## Graph Structure

- Multigraph does not allow loop
- Pseudograph is a special multigraph allows loop
- Sometimes, the meanings of Pseudograph and Multigraph are the same

## Graph Structure Summary

| Undirected |               | No Loop                  | Loop                        |
|------------|---------------|--------------------------|-----------------------------|
|            | Single Edge   | Simple Graph             | 1                           |
|            | Multiple Edge | Multigraph               | Pesudograph<br>(Multigraph) |
|            |               |                          |                             |
| Directed   |               | No Loop                  | Loop                        |
|            | Single Edge   | Simple Directed<br>Graph | /                           |
|            | Multiple Edge | Directed<br>Multigraph   | Mixed Graph                 |

### **Adjacent / Neighbor**

#### Undirected graph

- Let (v<sub>1</sub>, v<sub>2</sub>) is an edge
- v<sub>1</sub> and v<sub>2</sub> are endpoints
- v<sub>1</sub> is adjacent to v<sub>2</sub>
- Also mean
   "v<sub>2</sub> is adjacent to v<sub>1</sub>" since (v<sub>1</sub>, v<sub>2</sub>) = (v<sub>2</sub>, v<sub>1</sub>)

- Let (v<sub>1</sub>, v<sub>2</sub>) is an edge
- v<sub>1</sub> is initial vertex
- v<sub>2</sub> is terminal (end) vertex
- v<sub>1</sub> is adjacent to v<sub>2</sub>
- v<sub>2</sub> is adjacent from v<sub>1</sub>
- Do not mean
   "v<sub>2</sub> is adjacent to v<sub>1</sub>"

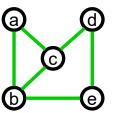

**V** 

### **Adjacent / Neighbor**

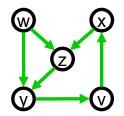

- e incidents with v<sub>1</sub> and v<sub>2</sub>
- e connects v<sub>1</sub> and v<sub>2</sub>
- Example:

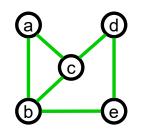

w is adjacent to z z is not adjacent to w

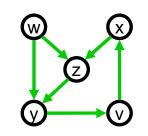

е

### **Neighbor Set**

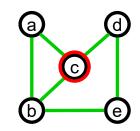

- Neighbor Set N(v) contains all adjacent vertices of v
- For example: N(c) = {a,b,d}
   N(z) = {y}

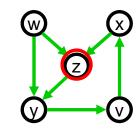

### Degree

- Undirected graph
  - Degree: number of edges containing that vertex (Adjacent vertex number)
  - Isolated vertex: deg = 0
  - Pendant vertex: deg = 1
  - E.g. deg(c) = 3

#### **Directed graph**

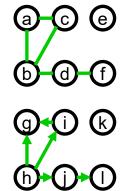

- In-Degree: in-bound edge number
- Out-Degree: out-bound edge number
- E.g. deg<sup>-</sup>(z) = 2 deg<sup>+</sup>(z) = 1

### **Degree: Example**

What are the degrees of the following vertices?

| deg(a) = <mark>2</mark> | deg <sup>_</sup> (g) = <mark>2</mark> | deg <sup>+</sup> (g) = <mark>0</mark> |
|-------------------------|---------------------------------------|---------------------------------------|
| deg(b) = <mark>3</mark> | deg <sup>-</sup> (h) = <mark>0</mark> | deg <sup>+</sup> (h) = <mark>3</mark> |
| deg(c) = <mark>2</mark> | deg <sup>_</sup> (i) = 1              | deg <sup>+</sup> (i) = 1              |
| deg(d) = 2              | deg <sup>_</sup> (j) = 1              | $deg^{+}(j) = 1$                      |
| deg(e) = <mark>0</mark> | deg <sup>_</sup> (k) = <mark>0</mark> | $deg^{+}(k) = 0$                      |
| deg(f) = 1              | $deg^{-}(l) = 1$                      | $deg^{+}(I) = 0$                      |

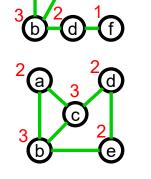

13

15

### **Degree Sequence**

 A degree sequence is a monotonic nonincreasing sequence of the degrees of vertices in an undirected graph.

(3,3,2,2,2) Degree sequence

(2.3.2.2.0.1) Not monotonic nonincreasing

(3,2,2,2,1,0) Degree sequence

#### Degree Handshaking Theorem 1

For any undirected graph G = (V, E),

$$2|E| = \sum_{v \in V} \deg(v)$$

Twice number of edges = sum of degrees

a

- Each edge maps to two vertices (start & end)
- It also applies to multiple edges and loop

of degrees c e |E| = 5 deg(a) = 2 deg(b) = 3 deg(c) = 2 deg(d) = 2 deg(d) = 2 deg(e) = 0 deg(f) = 1

#### Degree: Handshaking Theorem 1 Example 1

- How many edges are there in a graph with 10 vertices each of degree six?
- Total degree = 10 x 6 = 60
- According to Handshaking Theorem

$$2|E| = \sum_{v \in V} \deg(v)$$

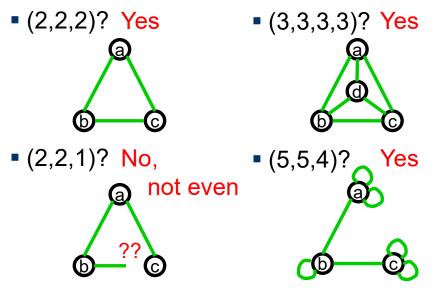

• |E| = 60/2 = 30

16

#### Degree: Handshaking Theorem 1

### Example 1

Is there a graph with degree sequence...

#### Degree Handshaking Theorem 2

Proof

 Let V<sub>o</sub> and V<sub>e</sub> be the set of vertices of odd and even degree

$$2|E| = \sum_{v \in V} \deg(v) = \sum_{v \in V_o} \deg(v) + \sum_{v \in V_e} \deg(v)$$
  
even also be even Must be even

- As summation of even degree (2<sup>nd</sup> term) is even
- Summation of odd degree (1<sup>st</sup> term) is also even
  - As deg(v) is odd for  $v \in V_o$
  - The number of deg(v) must be even for  $v \in V_o$

### Degree Handshaking Theorem 2

Undirected graph has an even number of vertices of odd degree

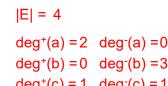

18

#### Degree Handshaking Theorem 3

For any directed graph G = (V, E),

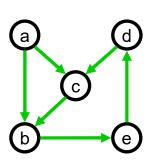

$$E| = \sum_{v \in V} deg^+(v) = \sum_{v \in V} deg^-(v)$$

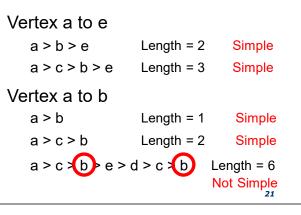

- Each edge maps to one initial and on end vertices
- It also applies to multiple edges and loop

### Path

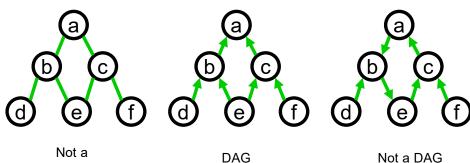

- A sequence of vertices v<sub>1</sub>, v<sub>2</sub>, ..., v<sub>n</sub> of length *n*-1 with an edge from  $v_i$  to  $v_{i+1}$  for  $1 \le i < n$
- A path is **simple** if all vertices on the path are distinct

### Acyclic

- A graph without cycle is called acyclic
- A directed graph without cycles is called a **Directed Acyclic Graph (DAG)**

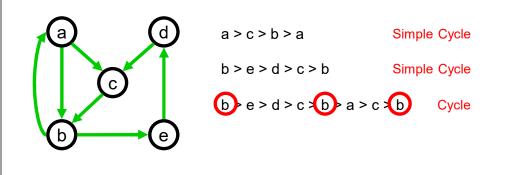

Undirected Acyclic

Not a DAG

### Cycle (Circuit)

- A path connects v<sub>i</sub> to itself
- A cycle is **simple** if the path is simple, except the first and last vertices are the same

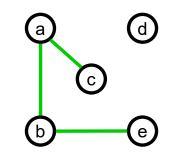

22

### **Connectedness**

- Vertices v, w are connected if and only if there is a path starting at v and ending at w
- Every graph consists of separate connected pieces called connected components

2

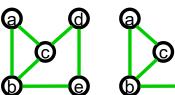

Are a and e connected? Yes Are a and d connected? No

How many connected components?

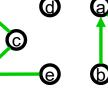

### Connectedness

#### Undirected graph

Connected: if there is at least one path from any vertex to any other (Only one connected component)

Connected

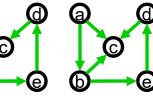

Not Connected

Strongly

Connected

- Weakly connected: Directed graph without considering directions is connected
- Strongly connected: Directed graph with considering direction is connected

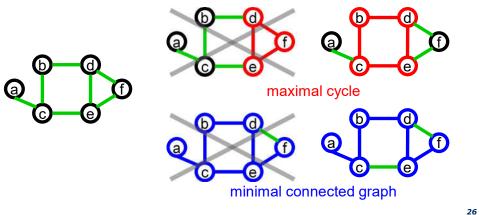

Weakly Connected

25

### Maximal/Minimal graph

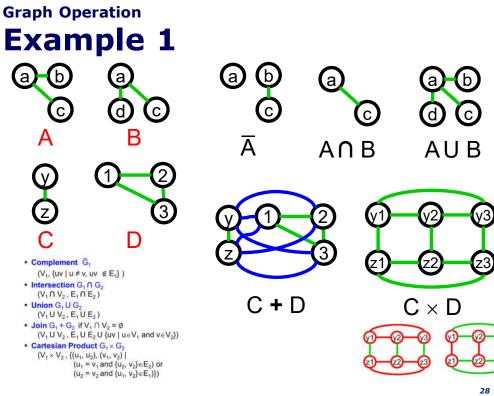

A graph G is said to be a maximal graph (minimal graph) with respect to a property P if G has property P and no proper supergraph (subgraph) of G has the property P

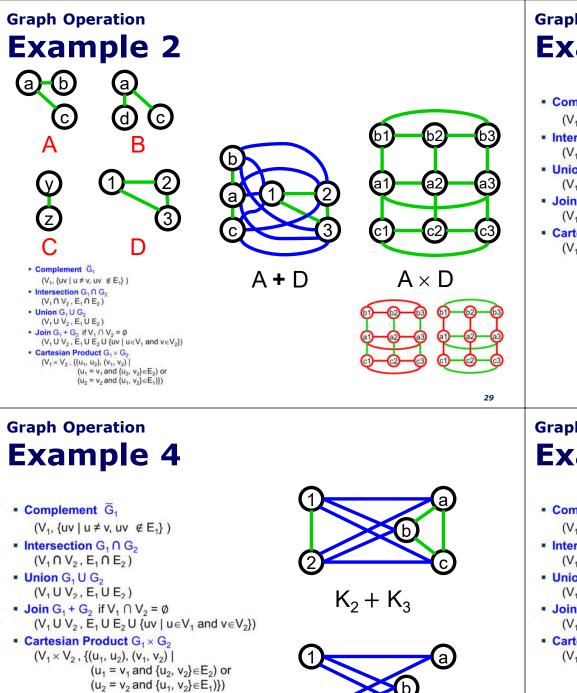

### **Graph Operation**

- Given  $G_1 = (V_1, E_1)$  and  $G_2 = (V_2, E_2)$ 
  - Complement G<sub>1</sub>  $(V_1, \{uv \mid u \neq v, uv \notin E_1\})$
  - Intersection G₁ ∩ G₂  $(V_1 \cap V_2, E_1 \cap E_2)$
  - Union  $G_1 \cup G_2$  $(V_1 \cup V_2, E_1 \cup E_2)$
  - Join  $G_1 + G_2$  if  $V_1 \cap V_2 = \emptyset$  $(V_1 \cup V_2, E_1 \cup E_2 \cup \{uv \mid u \in V_1 \text{ and } v \in V_2\})$
  - Cartesian Product G<sub>1</sub> × G<sub>2</sub>  $(V_1 \times V_2, \{(u_1, u_2), (v_1, v_2)\}$

$$(u_1 = v_1 \text{ and } \{u_2, v_2\} \in E_2) \text{ or } (u_2 = v_2 \text{ and } \{u_1, v_2\} \in E_1)\})$$

#### **Graph Operation** Example 3

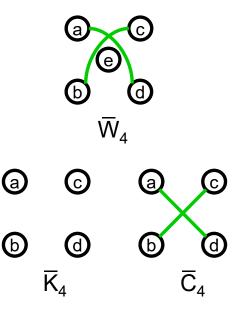

Complement G<sub>1</sub>

 $(V_1, \{uv \mid u \neq v, uv \notin E_1\})$ 

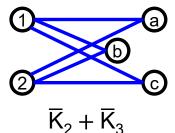

- Intersection G₁ ∩ G₂  $(V_1 \cap V_2, E_1 \cap E_2)$
- Union G<sub>1</sub> U G<sub>2</sub>  $(V_1 U V_2, E_1 U E_2)$

• Join  $G_1 + G_2$  if  $V_1 \cap V_2 = \emptyset$ 

- $(V_1 \cup V_2, E_1 \cup E_2 \cup \{uv \mid u \in V_1 \text{ and } v \in V_2\})$ Cartesian Product G<sub>1</sub> × G<sub>2</sub>
  - $(V_1 \times V_2, \{(u_1, u_2), (v_1, v_2)\}$  $(u_1 = v_1 \text{ and } \{u_2, v_2\} \in E_2) \text{ or }$  $(u_2 = v_2 \text{ and } \{u_1, v_2\} \in E_1)\})$

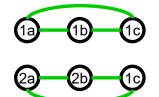

30

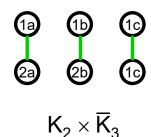

#### **Graph Operation Example 5**

- Complement G<sub>1</sub>  $(V_1, \{uv \mid u \neq v, uv \notin E_1\})$
- Intersection G₁ ∩ G₂  $(V_1 \cap V_2, E_1 \cap E_2)$
- Union G<sub>1</sub> U G<sub>2</sub>  $(V_1 \cup V_2, E_1 \cup E_2)$
- Join  $G_1 + G_2$  if  $V_1 \cap V_2 = \emptyset$  $(V_1 \cup V_2, E_1 \cup E_2 \cup \{uv \mid u \in V_1 \text{ and } v \in V_2\})$
- Cartesian Product G<sub>1</sub> × G<sub>2</sub>  $(V_1 \times V_2, \{(u_1, u_2), (v_1, v_2)\}$  $(u_1 = v_1 \text{ and } \{u_2, v_2\} \in E_2)$  or  $(u_2 = v_2 \text{ and } \{u_1, v_2\} \in E_1)\})$

 $\overline{K}_2 \times K_3$ 

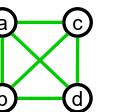

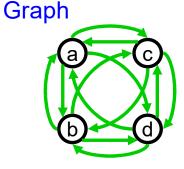

#### Type of Graph Complete Graph

 Complete graph K<sub>n</sub> if there is an edge between every pair of vertices, where n is the number of vertices

K₄

 Complete Undirected Graph

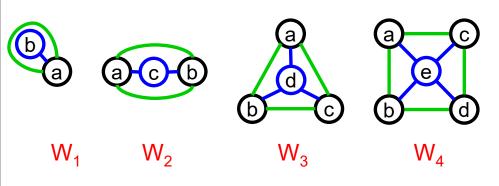

Complete Directed

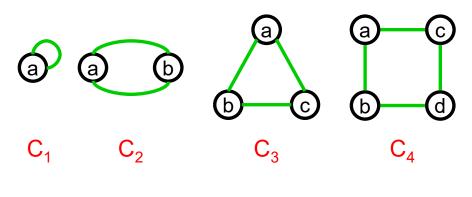

#### Type of Graph Wheel Graph

 Wheel graph W<sub>n</sub> is a cycle graph with an extra vertex in the middle which contact to each of other vertices

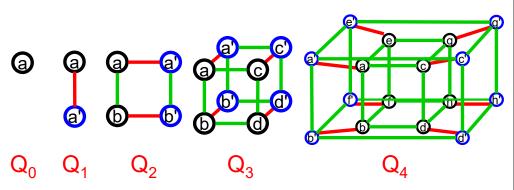

#### Type of Graph Cycle Graph

- Cycle graph C<sub>n</sub> is a circular graph with V = {0,1,2,...,n-1} where vertex i is connected to (i+1) mod n and to (i-1) mod n
  - like a polygon

#### Type of Graph Cube

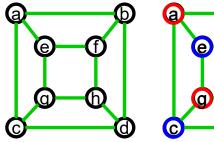

- n-cube Q<sub>n</sub> is defined recursively.
  - Q<sub>0</sub> is just a vertex
  - Q<sub>n+1</sub> is gotten by taking 2 copies of Q<sub>n</sub> and joining each vertex v of Q<sub>n</sub> with its copy v'

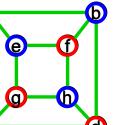

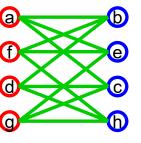

33

#### Type of Graph Bipartite Graph

- A graph is bipartite if all vertices can be separated into two partitions, (i.e. V = V<sub>1</sub> ∪ V<sub>2</sub> and Ø = V<sub>1</sub> ∩ V<sub>2</sub>) so that any two adjacent vertices are in different partitions
  - (V<sub>1</sub>, V<sub>2</sub>) is called a bipartition of V of G

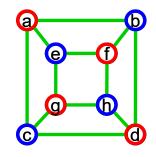

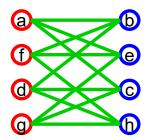

37

#### Type of Graph Bipartite Graph: Theorem

 A simple graph is bipartite if and only if it is possible to assign one of two different colors to each vertex of the graph so that no two adjacent vertices are assigned the same color

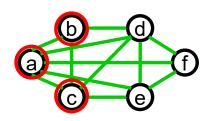

#### Type of Graph Bipartite Graph: Example 1

- Is C<sub>n</sub> (Cycle graph) bipartite?
  - When n is even, Yes
    - All odd vertices are in a color and all vertices numbers are in another color
    - All vertices are only adjacent to opposite color
  - When n is odd, No (except n = 1)
    - Both n and 1 are odd, but n<sup>th</sup> vertex is next to the 1<sup>st</sup> vertex

#### Type of Graph Bipartite Graph: Example 2

Is the given graph bipartite?

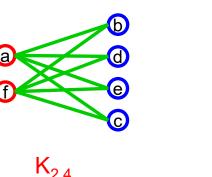

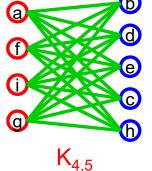

NO

 For example, consider a, b, and c. There is two adjacent vertices are assigned the same color if only two colors are allowed

#### Type of Graph Complete Bipartite Graph

 When all possible edges exist in a simple bipartite graph with m and n vertices in two partitions, the graph is called complete bipartite K<sub>m,n</sub>

### Subgraph

- Let G = (V,E) and H = (W,F) be graphs. H is a subgraph of G, if W ⊆ V and F ⊆ E
  - Subgraph is a graph inside another group
- A subgraph H of G is a proper subgraph of G

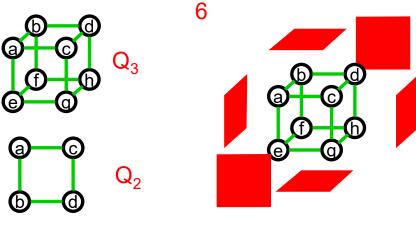

## Subgraph: Example

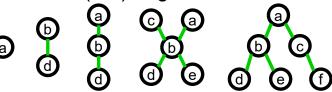

41

How many different Q<sub>2</sub> subgraphs does Q<sub>3</sub> have?

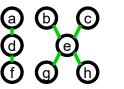

### Tree

- Tree is an undirected, <u>connected</u> and acyclic graph
  - n vertices has (n-1) edges

- Forest is an undirected, <u>disconnected</u>, acyclic graph
  - Disjoint collection of trees

#### Tree Theorem 1

- A tree with at least two vertices has at least two leaves
- Assume P is a longest path in a tree T
- Prove its endpoints are leaves
- Suppose v is not a leaf, then v has at least two neighbors, x and y
- One of them (say x) must not in P, otherwise a cycle
- Let P' be the path that begins at x followed by P
- This is a longer path than P which is contradict to the assumption

#### Tree Theorem 2

- A tree on n vertices has n 1 edges
- For N(1)
  - If n = 1, then T has no edges
- Assume N(k) is true
  - T with n vertices has exactly n 1
- Show N(k+1)

## Tree **Theorem 2**

- Show T with n+1 vertices has exactly n 1
- Since T is a tree, T has at least two leaves (Theorem 1)
- Let T' be the graph created by deleting a leaf in T
- Note that T' is a tree with n vertices, since:
  - T' is connected and acyclic
  - T' has one less vertex than T
- According to N(k), T' has n 1 edges
- Since T' has one less edge than T, T has K edges

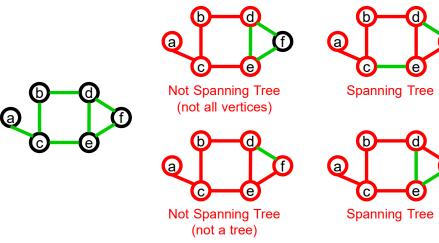

#### Tree Theorem 3

- Let G be a graph with n vertices. Then the following are equivalent:
  - 1. G is a tree
  - 2. G is a maximal acyclic graph
  - 3. G is a minimal connected graph
  - 4. G is acyclic and it has n 1 edges
  - 5. G is connected and it has n 1 edges
  - 6. Between any two distinct vertices of G there exists a unique path

45

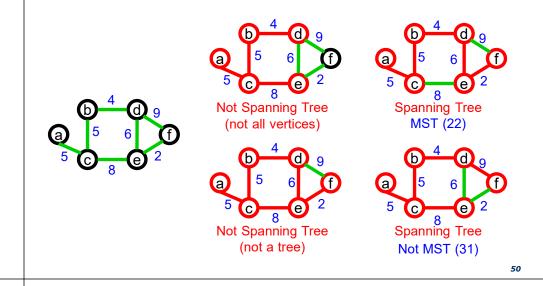

#### Tree Spanning Tree

 Spanning Tree in a connected graph G is a subgraph H of G that includes all the vertices of G and is also a tree

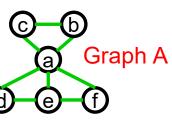

#### Tree Minimum Spanning Tree

 Minimum Spanning Trees (MST) is a spanning tree with the minimal cost to call all the vertices

### **Graph Isomorphism**

Is the following graphs the same as Graph A?

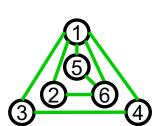

Yes

**Different Labels** 

Yes Different Positions

Yes Different Label and Positions

### **Graph Isomorphism**

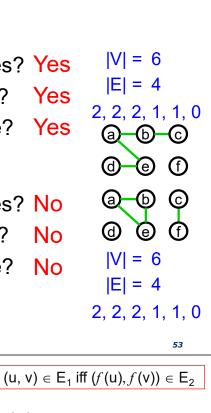

- Applications
  - Checking fingerprint
  - Testing molecules

### **Graph Isomorphism**

- If  $G_1 \cong G_2$ , do they have
  - the same number of vertices? Yes
  - the same number of edges? Yes
  - the same degree sequence? Yes

• Are  $G_1 \cong G_2$ , if they have

- the same number of vertices? No
- the same number of edges? No
- the same degree sequence? No

f(a) = 3

f(b) = 1

f(c) = 2

f(d) = 4

### **Graph Isomorphism**

•  $G_1 = (V_1, E_1) \cong G_2 = (V_2, E_2)$  if there is a bijective function  $f: V_1 \rightarrow V_2$  such that for all  $(u, v) \in E_1$ :

 $(\mathbf{u}, \mathbf{v}) \in \mathsf{E}_1$  iff  $(f(\mathbf{u}), f(\mathbf{v})) \in \mathsf{E}_2$ 

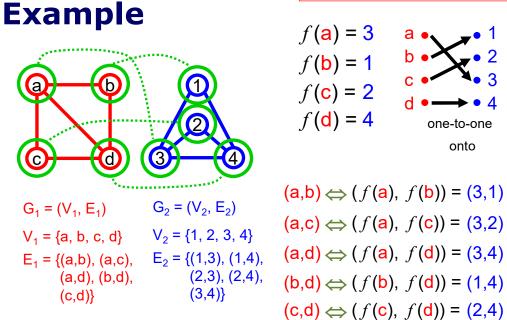

- It is edge-preserving vertex matching
  - If there is an edge in the original graph, there is an edge after the mapping, vice versa.

#### 54

#### **Graph Isomorphism Self-complementary**

- A graph G is called self-complementary if  $\mathbf{G} \cong \overline{\mathbf{G}}$ 
  - $C_5$  and  $\overline{C_5}$  are self-complementary ( $C_5 \cong \overline{C_5}$ )

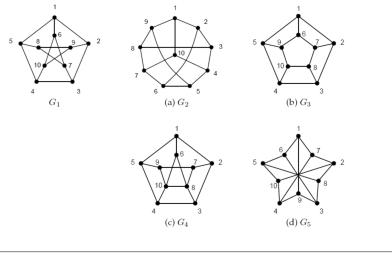

**Graph Isomorphism** 

onto

### **Graph Isomorphism**

- Showing Isomorphism is not easy
  - No general method which is more efficient than trying all possibilities

57

### Graph Isomorphism

- Showing non-isomorphic is simpler
  - Violate any isomorphic-preserving property
  - Example: Are they isomorphism? NO
